Keywords: OpenAIRE, repositories, research data, open access

The OpenAIREplus project (Dec 2011–May 2014) continues and extends the scope of OpenAIRE to promote and monitor open access to a wider audience and to more research output types. It will create a robust, participatory service for the cross-linking of peer-reviewed scientific publications and associated datasets.

More specifically, it aims at growing a richer graph of data, covering material from all research disciplines and further countries, and including projects from national funding schemes, non-peer-reviewed publications, and research datasets. Ultimately, OpenAIRE will extend its service to push beyond the realm of publications within FP7 and to widen the publication scope, but also to link publications to associated research data. This interlinking and reuse of research is seen as crucial to growth and innovation as Europe heads towards Horizon2020 and supporting an infrastructure for Open Science, for which Interoperability is the key.

This poster will outline the activities of OpenAIRE. 41 pan-European partners are involved in the project - including cross-disciplinary research communities – dedicated to facilitating collaboration across data infrastructures, providing information to scientists, non-scientists as well as to providers of value-added services. The publication repository networks are currently being expanded to attract data providers from domain specific scientific areas, such as data repositories, data infrastructures and journal editors.
